ReadSpace -- PDF Viewer Demo

This three-page document exists to exercise the ReadSpace PDF viewer.

Things to try with this file open:
1. Scroll continuously -- pages render lazily as they approach view.
2. Use the zoom controls; ’Fit width’ is the default.
3. Jump pages with the arrows in the toolbar.
4. Select this text with the mouse -- the pdf.js text layer is active.

The viewer runs pdf.js in a Web Worker, so the UI stays responsive even
for large documents. Pages are rendered at your device pixel ratio.

Page 2 -- Typography

PDF rendering happens on <canvas>, so what you see is exactly what a print shop would see: embedded fonts, vector shapes and images all drawn by the browser at full fidelity.

Readable software should stay out of your way. That is the design brief for ReadSpace: low chrome, calm colors, and typography you can tune - font family, size, line height and reading width - from the settings menu in the title bar.

Reading is the product; everything else is plumbing.

Page 3 -- Session Notes

Checklist for the v0.1 milestone:
[x] Open a folder and browse its file tree
[x] Tabs: preview tabs, pinning, reorder, unsaved indicator
[x] Viewers: Markdown, PDF, DOCX, HTML, TXT, images
[x] Preview / Edit toggle with save back to disk
[x] Resizable sidebar and independent content scrolling
[x] Light / dark / sepia themes with session restore

Next up: outline panel, find-in-document, split view and global search.
